Spinor operators

Consider N fermionic subsystems described by operators satisfying:

• Commutation relation if $a \neq b$

$$[\hat{\gamma}_a^j, \hat{\gamma}_b^k] = 0 \tag{1}$$

Anti-commutation relation

$$\{\hat{\gamma}_{a}^{j}, \hat{\gamma}_{a}^{k}\} = 2\delta^{jk}\hat{I}$$
⁽²⁾

where $a, b \in \{1, ..., N\}$ and $j, k \in \{1, ..., D\}$.

Hermitian condition

$$\hat{\gamma}_a^j = \hat{\gamma}_a^{j\dagger}, \tag{3}$$

Tracelessness condition

$$Tr\left[\left(\hat{\gamma}_{a_{1}}^{j_{1,1}}...\hat{\gamma}_{a_{1}}^{j_{1,d_{1}}}\right)\left(\hat{\gamma}_{a_{2}}^{j_{2,1}}...\hat{\gamma}_{a_{2}}^{j_{2,d_{2}}}\right)...\left(\hat{\gamma}_{a_{n}}^{j_{n,1}}...\hat{\gamma}_{a_{n}}^{j_{n,d_{n}}}\right)\right]=0$$
(4)

where $1 \leq a_1 < ... < a_n \leq N$ and $1 \leq j_{k,1} < ... < j_{k,d_k} \leq D$ for all k.

For D = 2 the spinor operators can be represented by tensor products of two out of three Pauli matrices (e.g. X̂ and Ŷ),

$$\begin{split} \hat{\gamma}_{1}^{1} &= \hat{X} \otimes \hat{I} \otimes \ldots \otimes \hat{I} \\ \hat{\gamma}_{1}^{2} &= \hat{Y} \otimes \hat{I} \otimes \ldots \otimes \hat{I} \\ \hat{\gamma}_{2}^{1} &= \hat{I} \otimes \hat{X} \otimes \ldots \otimes \hat{I} \\ \hat{\gamma}_{2}^{2} &= \hat{I} \otimes \hat{Y} \otimes \ldots \otimes \hat{I} \\ \hat{\gamma}_{N}^{2} &= \hat{I} \otimes \hat{I} \otimes \ldots \otimes \hat{X} \\ \hat{\gamma}_{N}^{1} &= \hat{I} \otimes \hat{I} \otimes \ldots \otimes \hat{Y}. \end{split}$$

▶ For D = 4 the spinor operators. can be represented by tensor products of euclidean Dirac matrices

For D = 2 the spinor operators can be represented by tensor products of two out of three Pauli matrices (e.g. X̂ and Ŷ),

$$\hat{\gamma}_{1}^{1} = \hat{X} \otimes \hat{I} \otimes \dots \otimes \hat{I}
\hat{\gamma}_{1}^{2} = \hat{Y} \otimes \hat{I} \otimes \dots \otimes \hat{I}
\hat{\gamma}_{2}^{1} = \hat{I} \otimes \hat{X} \otimes \dots \otimes \hat{I}
\hat{\gamma}_{2}^{2} = \hat{I} \otimes \hat{Y} \otimes \dots \otimes \hat{I}
\dots
\hat{\gamma}_{N}^{1} = \hat{I} \otimes \hat{I} \otimes \dots \otimes \hat{X}
\hat{\gamma}_{N}^{2} = \hat{I} \otimes \hat{I} \otimes \dots \otimes \hat{Y}.$$
(5)

Sar

- ▶ For D = 4 the spinor operators. can be represented by tensor products of euclidean Dirac matrices
- ► Although the dimensionality *D* is kept arbitrary the two cases with *D* = 1 and *D* = 3 will turn out to be dual to simple classical models on S⁰ and on S² configuration/target spaces.

HAMILTONIAN

► From the spinor operators we construct a Hamiltonian operator

$$\hat{H}_{q} = \sum_{j_{1}...j_{N} \in \{0,...,D\}} H_{j_{1}...j_{N}} \,\hat{\gamma}_{1}^{j_{1}}...\hat{\gamma}_{N}^{j_{N}}.$$
(6)

where $\hat{\gamma}_a^0 \equiv \hat{I}$ and all of the components $H_{j_1...j_N}$ are real numbers.

Quantum partition function can be expanded as power series

$$\mathcal{Z}_{\mathbf{q}}[\mathbf{H}] = Tr\left[\exp\left(\beta\hat{H}_{\mathbf{q}}\right)\right] = \sum_{n=0}^{\infty} \frac{\beta^{n}}{n!} Tr\left[\left(\sum_{j_{1}\dots j_{N} \in \{0,\dots,D\}} \mathbf{H}_{j_{1}\dots j_{N}} \,\hat{\gamma}_{1}^{j_{1}}\dots\hat{\gamma}_{N}^{j_{N}}\right)^{n}\right]$$

▶ and each power of Hamiltonian operator into a *formal* sum

$$Tr\left[\left(\sum_{j_1\dots j_N\in\{0,\dots,D\}}H_{j_1\dots j_N}\,\hat{\gamma}_1^{j_1}\dots\hat{\gamma}_N^{j_N}\right)^n\right] = \sum_A h_A \,Tr\left[\hat{\Gamma}^A\right] \quad (7)$$

where h_A 's represent products of $H_{j_1...j_N}$'s components and $\hat{\Gamma}^A$'s the corresponding products of the spinor operators.

COMBINATIONS OF TERMS

- Let σ(A) be a set of all abstract-indices which are equivalent to A up to different combinations of terms from Hamiltonian.
- ► Then

$$\sum_{A} h_A \hat{\Gamma}^A = \sum_{A} \mu(A) h_A : \hat{\Gamma}^A :$$
(8)

where an ordered product of $\hat{\gamma}_a^j$ operators is given by

 $: \hat{\Gamma}^A := \theta(\hat{\Gamma}^A)\hat{\Gamma}^A$

for some sign $\theta(\hat{\Gamma}^A)=\pm 1$ and the "average" sign is

$$\mu(A) = \frac{1}{|\sigma(A)|} \sum_{B \in \sigma(A)} \theta(\hat{\Gamma}^B)$$
(9)

 Then the trace of powers of Hamiltonian can be written in terms of ordered operators

Motivations	INTRODUCTION	COMMUTING OPERATORS	ANTI-COMMUTING OPERATORS	GENERIC SYSTEMS
0	00000	000	00000	00000

COMBINATIONS OF TERMS

►

$$Tr\left[\left(\sum_{j_1\dots j_N\in\{0,\dots,D\}}H_{j_1\dots j_N}\,\hat{\gamma}_1^{j_1}\dots\hat{\gamma}_N^{j_N}\right)^n\right]=\sum_A\mu(A)h_ATr\left[:\,\hat{\Gamma}^A:\right]$$

• For example, if A represents $(H_{02}\hat{\gamma}_2^2)$ $(H_{30}\hat{\gamma}_1^3)$, then

$$\begin{array}{rcl} h_{A} & = & H_{02}H_{30} \\ \hat{\Gamma}^{A} & = & \hat{\gamma}_{2}^{2}\hat{\gamma}_{1}^{3} \\ : \hat{\Gamma}^{A}: & = & \hat{\gamma}_{1}^{3}\hat{\gamma}_{2}^{2} \\ \theta(\hat{\Gamma}^{A}) & = & 1 \\ \mu(A) & = & (1+1)/2 = 1, \end{array}$$

but if *A* represents $(H_{03}\hat{\gamma}_2^3)(H_{02}\hat{\gamma}_2^2)$, then

$$\begin{array}{rcl} h_{A} & = & H_{03}H_{02} \\ \hat{\Gamma}^{A} & = & \hat{\gamma}_{2}^{3}\hat{\gamma}_{2}^{2} \\ : \hat{\Gamma}^{A} : & = & \hat{\gamma}_{2}^{2}\hat{\gamma}_{2}^{3} \\ \theta(\hat{\Gamma}^{A}) & = & -1 \\ \mu(A) & = & (1-1)/2 = 0. \end{array}$$

- Then by matching individual terms we get

$$\mathcal{N}\int \left(\prod_{a} dx_{a}\rho(x_{a})\right) X^{A} = Tr\left[:\hat{\Gamma}^{A}:\right].$$
(13)

- The ordered product of operators : $\hat{\Gamma}^A$: either contains
 - even number of $\hat{\gamma}_a^1$ operators for every *a*

$$\Rightarrow Tr\left[\hat{\Gamma}^{A}\right] = Tr\left[\hat{I}\right] \equiv \mathcal{N}$$
(14)

• or \exists at least one *a* for which there is an odd number of $\hat{\gamma}_a^{1}$'s

$$\Rightarrow Tr\left[\hat{\Gamma}^{A}\right] = 0 \tag{15}$$

Then the measure of integration ρ(x_a) should be such that all odd statistical moments vanish and all even statistical moment are the same,

$$\int (x_a)^n \rho(x_a) dx_a = \begin{cases} 1 & \text{if } n \text{ is even} \\ 0 & \text{if } n \text{ is odd.} \end{cases}$$
(16)

CLASSICAL DUAL

But this is can be easily achieved with

$$\rho(x_a) = \frac{\delta(x_a - 1) + \delta(x_a + 1)}{2}$$
(17)

▲ロト ▲ 理 ト ▲ 王 ト ▲ 王 - の Q (~

which corresponds to a classical partition function

$$\mathcal{Z}_{c}[H] = \mathcal{N} \sum_{x_{1}...x_{N} \in \{1, -1\}} \exp\left(\beta \sum_{j_{1}...j_{N} \in \{0, 1\}} H_{j_{1}...j_{N}} x_{1}^{j_{1}}...x_{N}^{j_{N}}\right).$$
(18)

We conclude that the quantum system is dual to a classical system

$$\hat{H}_{q} = \sum_{j_{1}...j_{N} \in \{0,1\}} H_{j_{1}...j_{N}} \,\hat{\gamma}_{1}^{j_{1}}...\hat{\gamma}_{N}^{j_{N}} \quad \Leftrightarrow \quad H_{c} = \sum_{j_{1}...j_{N} \in \{0,1\}} H_{j_{1}...j_{N}} \, x_{1}^{j_{1}}...x_{N}^{j_{N}}$$

where x_a are the classical spinors (or classical scalars on S^0 target space)

CLASSICAL DUAL

But this is can be easily achieved with

$$\rho(x_a) = \frac{\delta(x_a - 1) + \delta(x_a + 1)}{2}$$
(17)

which corresponds to a classical partition function

$$\mathcal{Z}_{c}[H] = \mathcal{N} \sum_{x_{1}...x_{N} \in \{1, -1\}} \exp\left(\beta \sum_{j_{1}...j_{N} \in \{0, 1\}} H_{j_{1}...j_{N}} x_{1}^{j_{1}}...x_{N}^{j_{N}}\right).$$
(18)

We conclude that the quantum system is dual to a classical system

$$\hat{H}_{q} = \sum_{j_{1}...j_{N} \in \{0,1\}} H_{j_{1}...j_{N}} \,\hat{\gamma}_{1}^{j_{1}}...\hat{\gamma}_{N}^{j_{N}} \quad \Leftrightarrow \quad H_{c} = \sum_{j_{1}...j_{N} \in \{0,1\}} H_{j_{1}...j_{N}} \, x_{1}^{j_{1}}...x_{N}^{j_{N}}$$

where *x_a* are the classical spinors (or classical scalars on *S*⁰ target space)
Note that the eigenvalues of the quantum Hamiltonian must be

$$E_x = \sum_{j_1 \dots j_N \in \{0,1\}} H_{j_1 \dots j_N} \, x_1^{j_1} \dots x_N^{j_N}, \tag{19}$$

where $x \in \{-1, 1\}^N$.

PARTITION FUNCTIONS

• Quantum partition function for a single spinor (N = 1), but with D > 1

$$\mathcal{Z}_{\mathbf{q}}[\mathbf{H}] = \sum_{n=0}^{\infty} \frac{\beta^n}{n!} \ Tr\left[\left(\sum_{j \in \{1, \dots, D\}} \mathbf{H}_j \, \hat{\gamma}^j\right)^n\right] \tag{20}$$

Classical partition function for a system of *D* scalars

$$\mathcal{Z}_{c}[H] = \mathcal{N} \int d^{D} x \rho(x) \sum_{n=0}^{\infty} \frac{\beta^{n}}{n!} \left(\sum_{j \in \{1, \dots, D\}} H_{j} x^{j} \right)^{n}.$$
 (21)

The two systems are dual if

$$\mathcal{N} \int d^{D} x \rho(x) \sum_{A} h_{A} X^{A} = \sum_{A} \mu(A) h_{A} Tr \left[: \hat{\Gamma}^{A} : \right],$$

$$\mathcal{N} \int d^{D} x \rho(x) X^{A} = \mu(A) Tr \left[: \hat{\Gamma}^{A} : \right]$$

$$\mathcal{N} \int d^{D} x \rho(x) \prod_{k} (x^{k})^{2n_{k}} = \mu(A) Tr \left[\prod_{k} (\hat{\gamma}^{k})^{2n_{k}}\right]$$

$$\int d^{D} x \rho(x) \prod_{k} (x^{k})^{2n_{k}} = \mu(A) \qquad (22)$$

MULTINOMIALS

- Consider the following two multinomials:
 - a sum of commuting scalars raised to some even power

$$\begin{pmatrix} x^{1} + x^{2} + \dots + x^{D} \end{pmatrix}^{2K} = \sum_{\substack{m_{1} + \dots + m_{D} = 2K \\ m_{1} + \dots + m_{D} = 2K}} \frac{(m_{1} + \dots + m_{D})!}{(m_{1})!\dots(m_{D})!} (x^{1})^{m_{1}}\dots(x^{D})^{m_{D}}$$

$$= \sum_{\substack{m_{1} + \dots + m_{D} = 2K \\ \hline{\prod_{k}(m_{k})!}} (x^{1})^{m_{1}}\dots(x^{D})^{m_{D}}$$

a sum of anti-commuting operators raised to the same power

$$\begin{split} \left(\hat{\gamma}^{1} + \hat{\gamma}^{2} + \ldots + \hat{\gamma}^{D}\right)^{2K} &= \left((\hat{\gamma}^{1})^{2} + (\hat{\gamma}^{2})^{2} + \ldots + (\hat{\gamma}^{D})^{2}\right)^{K} \\ &= \sum_{n_{1} + \ldots + n_{D} = K} \frac{(n_{1} + \ldots + n_{D})!}{(n_{1})! \dots (n_{D})!} (\hat{\gamma}^{1})^{2n_{1}} \dots (\hat{\gamma}^{D})^{2n_{D}} \\ &= \sum_{n_{1} + \ldots + n_{D} = K} \underbrace{\frac{(\sum_{k} n_{k})!}{\prod_{k} (n_{k})!}}_{(\hat{\gamma}^{1})^{2n_{1}} \dots (\hat{\gamma}^{D})^{2n_{D}}}. \end{split}$$

Separate terms in the expansion of operators represent products of γ^k's applied in different orders (or combinations σ(A)) and we are interested in products of m₁ = 2n₁ of γ¹'s, m₂ = 2n₂ of β²/₂'s, etc. (Ξ) Ξ (¬)

MEASURE OF INTEGRATION

$$\mu(A) = \frac{1}{|\sigma(A)|} \sum_{B \in \sigma(A)} \theta(\hat{\Gamma}^B) = \frac{\prod_k (2n_k)!}{(\sum_k 2n_k)!} \frac{(\sum_k n_k)!}{\prod_k n_k!} = \int d^D x \, \rho(x) \, \prod_k (x^k)^{2n_k}$$

where *A* can represent an arbitrary product of terms with $2n_k$ of $\hat{\gamma}^k$'s The moments generating function of $\rho(x)$

$$M(p_{1},...,p_{D}) = \sum_{n_{1},...,n_{D}} \left(\frac{\prod_{k}(2n_{k})!}{(\sum_{k}2n_{k})!} \frac{(\sum_{k}n_{k})!}{\prod_{k}n_{k}!} \right) \frac{p_{1}^{2n_{1}}...p_{D}^{2n_{D}}}{\prod_{k}(2n_{k})!} = = \cosh\left(\sqrt{p_{1}^{2}+...+p_{D}^{2}}\right)$$
(23)

The corresponding characteristic function is

$$M(ip_1, ..., ip_D) = \cos\left(\sqrt{p_1^2 + ... + p_D^2}\right) = \cos\left(\sqrt{\sum_k p_k^2}\right)$$
(24)

whose inverse Fourier transform is the desired measure of integration

$$\rho(x) = \int \frac{d^D p}{(2\pi)^D} \cos\left(\sqrt{\sum_k p_k^2}\right) \exp\left(i\sum_{k \in \mathbb{Z}^k} x^k p_k\right). \tag{25}$$

EXTENDED PARTITION FUNCTION

► Solution of the *D*+1-dimensional wave equation is given by

$$\varphi(x^{\mu}) = \int d^D y \,\partial_0 G(\vec{x}, x^0; \vec{y}, 0) \delta^{(D)}(\vec{y}) = \partial_0 G(\vec{x}, x^0) \tag{31}$$

where (with a slight abuse of notations)

$$G(x^{\mu}; y^{\mu}) = G(\vec{x} - \vec{y}, x^{0} - y^{0}) = G(x^{\mu} - y^{\mu}) = G(\vec{x} - \vec{y}, x^{0} - y^{0})$$

is the retarded Green's function of *D*+1-dim. d'Alembert operator.

► Extended (into "temporal" direction *T*) partition function is defined as

$$\mathcal{Z}_{c}[H,T] = \mathcal{N} \int d^{D}x \,\varphi(\vec{x},T) \exp\left(\beta \sum_{j \in \{1,...,D\}} H_{j} x^{j}\right)$$
(32)
$$= \mathcal{N} \int d^{D}y \int d^{D}x \,\exp\left(\beta \sum_{j \in \{1,...,D\}} H_{j} x^{j}\right) \partial_{0}G(\vec{x},T;\vec{y},0)\delta^{(D)}(\vec{y})$$

By construction it satisfies the desired duality condition

$$\mathcal{Z}_{c}[H,1] = \mathcal{Z}_{q}[H] \tag{33}$$

and also normalization conditions

$$\mathcal{Z}_{c}[H,0] = \mathcal{N}. \qquad \text{ for a product of } (34) \text{ for all } (34)$$

EXISTENCE OF DUALITY

• Quantum partition function for N > 1 quantum spinors with D > 1

$$\mathcal{Z}_{q}[\boldsymbol{H}] = \sum_{n=0}^{\infty} \frac{\beta^{n}}{n!} Tr\left[\left(\sum_{j_{1}\dots j_{N} \in \{0,\dots,D\}} \boldsymbol{H}_{j_{1}\dots j_{N}} \hat{\gamma}_{1}^{j_{1}}\dots \hat{\gamma}_{N}^{j_{N}}\right)^{n}\right]$$

► Classical partition function for a system of *ND* classical scalars

$$\mathcal{Z}_{\mathbf{c}}[\boldsymbol{H}] = \mathcal{N} \int \left(\prod_{a} d^{D} x_{a}\right) \rho(x) \sum_{n=0}^{\infty} \frac{\beta^{n}}{n!} \left(\sum_{j_{1} \dots j_{N} \in \{0, \dots, D\}} \boldsymbol{H}_{j_{1} \dots j_{N}} x_{1}^{j_{1}} \dots x_{N}^{j_{N}}\right)^{n}$$

The two systems are dual if all odd moments vanish and

$$\mathscr{H}\int\left(\prod_{a}d^{D}x_{a}\right)\rho(x)X^{A}=\mathscr{H}\int\left(\prod_{a}d^{D}x_{a}\right)\rho(x)\prod_{a,k}\left(x_{a}^{k}\right)^{2n_{k}^{a}}=\underline{\mathrm{Tr}\left[:\hat{\mathrm{P}}^{A}:]}\mu(A)$$

Then the measure only exists if

:
$$\hat{\Gamma}^A :=: \hat{\Gamma}^B : \Rightarrow \mu(A) = \mu(B).$$
 (36)

i.e. even if *A* and *B* are not in the same combination class, $\sigma(A) \neq \sigma(B)$, but the corresponding products of operators are the same, $:\hat{\Gamma}^A :=:\hat{\Gamma}^B :$, the statistical moments must also be the same, $\mu(A) = \mu(B)$.

SEPARABLE MEASURE

• Consider a Hamiltonian with components which can be expressed as

$$H_{j_1...j_N} = \sum_{k_1...k_N \in \{0,1\}} \mathcal{H}_{k_1...k_N} \eta_{1,j_1}^{k_1} ... \eta_{N,j_N}^{k_N}$$
(37)

where we assume that $H_{0...0} = 0$ and

$$\eta^0_{a,j} = \delta_{0j} \tag{38}$$

$$\eta_{a,0}^k = \delta_{k0} \tag{39}$$

Then the Hamiltonian operator

$$\hat{H}_{q} = \sum_{j_{1}...j_{N} \in \{0,...,D\}} H_{j_{1}...j_{N}} \hat{\gamma}_{1}^{j_{1}}...\hat{\gamma}_{N}^{j_{N}}$$

$$= \sum_{k_{1}...k_{N} \in \{0,1\}} \mathcal{H}_{k_{1}...k_{N}} \hat{\eta}_{1}^{k_{1}}...\hat{\eta}_{N}^{k_{N}}$$
(40)

where

$$\hat{\eta}_a = \hat{\eta}_a^1 = \sum_{j \in \{0,...,D\}} \eta_{a,j}^1 \hat{\gamma}_a^j = \sum_{j \in \{1,...,D\}} \eta_{a,j}^1 \hat{\gamma}_a^j$$
(41)

and

$$\hat{\eta}_a^0 = \sum_{j \in \{0, \dots, D\}} \eta_{a,j}^0 \hat{\gamma}_a^j = \sum_{j \in \{0, \dots, D\}} \delta_{0j} \hat{\gamma}_a^j = \hat{\gamma}_a^0 = \hat{I}.$$
(42)

DUAL SYSTEM

Since the combined operators satisfy a commutation relation

$$[\hat{\eta}_a, \hat{\eta}_b] = 0 \tag{43}$$

we can essentially follow the above analysis with

$$\begin{aligned} \mathcal{Z}_{\mathbf{c}}[\mathbf{H}] &= \mathcal{N} \int \left(\prod_{a} d^{D} x_{a} \rho(x_{a}) \right) \sum_{n=0}^{\infty} \frac{\beta^{n}}{n!} \left(\sum_{j_{1} \dots j_{N} \in \{0, \dots, D\}} \mathbf{H}_{j_{1} \dots j_{N}} x_{1}^{j_{1}} \dots x_{N}^{j_{N}} \right)^{n} \\ &= \mathcal{N} \int \left(\prod_{a} d^{D} x_{a} \rho(x_{a}) \right) \sum_{n=0}^{\infty} \frac{\beta^{n}}{n!} \left(\sum_{k_{1} \dots k_{N} \in \{0,1\}} \mathbf{H}_{k_{1} \dots k_{N}} \chi_{1}^{k_{1}} \dots \chi_{N}^{k_{N}} \right)^{n} \end{aligned}$$

where

$$\chi_a = \chi_a^1 = \sum_{j \in \{1, \dots, D\}} \eta_{a,j}^1 \chi_a^j \qquad \qquad \chi_a^0 = 1$$

► Result:

$$\mathcal{Z}_{\mathsf{c}}[H,T] = \mathcal{N} \int \left(\prod_{a} d^{D} x_{a} \,\partial_{0} G(\vec{x}_{a},T_{a}) \right) \exp \left(\beta \sum_{\substack{j_{1} \dots j_{N} \in \{0,1\}\\ q \in \mathbb{N} \ q \in \mathbb{N}$$

Note that the measure of integration is already normalized,

$$\int \left(\prod_{a} d^{D} x_{a} \,\partial_{0} G(\vec{x}_{a}, T_{a})\right) = 1, \tag{44}$$

▲ロト ▲ 理 ト ▲ 王 ト ▲ 王 - の Q (~

but it can be interpreted as probability only if $\partial_0 G(\vec{x}_a, T_a) \ge 0$.

• For example, when D = 1

$$\mathcal{Z}_{c}[H,T] = \mathcal{N} \int \prod_{a} \left(\frac{dx_{a}}{2} \left(\delta(x_{a}^{1} - T_{a}) + \delta(x_{a}^{1} + T_{a}) \right) \right) \exp\left(\beta H_{c}\right), \quad (45)$$

in agreement with pervious results, or when D = 3

$$\mathcal{Z}_{c}[H,T] = \mathcal{N} \int \prod_{a} \left(\frac{d^{3}x_{a}}{4\pi T_{a}^{2}} \delta \left(\sum_{k} \left(x_{a}^{k} \right)^{2} - T_{a}^{2} \right) \right) \exp\left(\beta H_{c}\right).$$
(46)

• Of course there is no reason to expect that the measure will remain positive for more general quantum systems and then the dual system defined in a similar manner would not be classical *per se*.

 We considered a quantum-classical duality mapping between quantum and classical systems of the form

$$\mathcal{Z}[\mathbf{H}] = Tr\left[\exp\left(\beta\sum_{I}\mathbf{H}_{I}\hat{\Gamma}^{I}\right)\right] \cong \int \mathcal{D}x \ \rho(x) \ e^{\beta\sum_{I}\mathbf{H}_{I}\Gamma^{I}(x)}$$

 We considered a quantum-classical duality mapping between quantum and classical systems of the form

$$\begin{aligned} \mathcal{Z}[H] &= Tr\left[\exp\left(\beta\sum_{I}H_{I}\hat{\Gamma}^{I}\right)\right] &\cong \int \mathcal{D}x \ \rho(x) \ e^{\beta\sum_{I}H_{I}\Gamma^{I}(x)} \\ &= \left[\int \mathcal{D}y\mathcal{D}x \ \delta(y)G'_{(x,T;y,0)}e^{\beta\sum_{I}H_{I}\Gamma^{I}(x)}\right]_{T=1} \end{aligned}$$

 We considered a quantum-classical duality mapping between quantum and classical systems of the form

- For a system of quantum spinors the dual classical system consists of scalars with only linear functions Γ^I(x)'s, but non-trivial measures of integrations ρ(x).
- Measure is given by relativistic Green's functions which suggest a possible mechanism for emergence of a classical space-time from anti-commutativity of quantum operators or vice versa
